Causal Transformer: Scaling Gradient-Based Causal Discovery to 500 Variables
Submitted to *Machine Learning* (Springer)

Name	Institution	Email	Expertise
Xun Zheng	Carnegie Mellon University	xunzheng@andrew.cmu.edu	NOTEARS
Jonas Peters	University of Copenhagen	jonas.peters@math.ku.dk	Structural Causal Models
Caroline Uhler	MIT / Broad Institute	cuhler@mit.edu	Causal Inference in Genomics
Nicolai Meinshausen	ETH Zurich	meinshausen@stat.math.ethz.ch	Stability Selection
Shohei Shimizu	Osaka University / RIKEN AIP	shohei-shimizu@ds.sanken.osaka-u.ac.jp	Non-causal Discovery

Rationale. All five recommended reviewers are among the authors cited in this manuscript, ensuring familiarity with the problem domain. Zheng and Shimizu developed foundational methods (NOTEARS, LiNGAM) that this work directly benchmarks against—their expertise is essential for evaluating the comparative claims. Peters provides theoretical depth on structural causal models and DAG identifiability, relevant to our theoretical analysis. Uhler bridges causal inference and genomics, matching our TCGA pan-cancer application. Meinshausen’s work on stability selection informs our bootstrap uncertainty quantification. The reviewers span four countries (US, Denmark, Switzerland, Japan), five institutions, and three subfields (differentiable causal discovery, causal theory, applied causal genomics), with no co-authorship or institutional conflicts with the author.
